**Transient Techniques in
Electrochemistry** - Digby Macdonald
2012-12-06

The study of electrochemical
reactions by relaxation or transient
techniques has expanded rapidly over
the last two decades. The impetus for
the develop ment of these techniques
has been the desire to obtain
quantitative data on the rates of
"fast" electrochemical processes,
including those coupled to
homogeneous chemical reactions in
solution. This has necessarily meant
the development of techniques that
are capable of delineating the
effects of mass transport and charge
transfer at very short times. The
purpose of this book is to describe
how the various transient techniques

may be used to obtain the desired information. Emphasis is placed upon the detailed mathematical development of the subject, since this aspect is the most frequently ignored in other texts in this field. In any relaxation or transient technique for the study of rate processes, it is necessary to disturb the reaction from equilibrium or the steady state by applying a perturbing impulse to the system. The system is then allowed to relax to a new equilibrium or steady-state position, and the transient (i. e. , the response as a function of time) is analyzed to extract the desired kinetic information. In electrochemical studies the heterogeneous rate constants are, in general, dependent upon the potential difference across the interface, so that the perturbing impulse frequently takes the form of a known variation in potential as a function of time.
