Immunology for Beginners - Massoud Abbas 2021-06-21

In the world of medicine, the term immunology is an expansive and complex field within the discipline of

anatomy. This branch of the medical sciences focuses on how the body's immune system works and interacts with other systems. The immune system is a network of cells, tissues, and organs whose main purpose is to protect the body from foreign substances. This system protects the body from disease and infections. This field of medicine is also responsible for the development of vaccines that humans use to protect themselves from such diseases. During my time working in the immunology sphere, I have had the opportunity to interact with several patients who come to me with different complaints and symptoms that may be related to some kind of immunological abnormality. I have also had to deal with patients who may have been exposed to some kind of infectious agent that could put their health at risk. That is why having an understanding of immunology is important for the general population. It is for this reason that I have written this book in an easy-to-digest format so that you can have a better understanding of the concepts behind immune function and disease. This book is based on my research as a doctor and biologist focusing on immunology and it offers a general overview of the different topics that are related to this discipline. This book provides information about the basics of immunology, the immunity system, and ways to prevent sickness. Some of the topics that are covered in this book include the process of immune response, the different types of white blood cells, the different types of antibodies and how they work, and many others. My name is Massoud Abbas, and this book is my way of giving back to society by sharing knowledge that I acquired while working and studying in this field.

Genetic Models of Immune and Inflammatory Diseases - Abul K. Abbas 2011-09-16

This book contains the proceedings of the Sero Symposia USA international symposium on Genetic Models of Immune and Inflammatory Diseases held on October 20 to 23, 1994, in Savannah, Georgia. The advent of methods for introducing genes into the germlines of mice, and for targeted disruption of particular genes by homologous recombination, has provided scientists in many disciplines with an extraordinarily powerful set of analytical tools. Some of the most informative applications of transgenic and gene knockout technology

have been in studies of lymphocyte development and activation. The goal of this symposium was to bring together investigators using these genetic approaches for analyzing the immune system, with a view to defining common themes and novel directions. Transgenic mice have a wide variety of important applications in immunology. Defined proteins can be expressed in selected tissues throughout development, thus acquiring the essential characteristic of "self" antigens. Such models have been used to study how immune responses to these artificially created "self" antigens are controlled. Antigen receptors of lymphocytes have been expressed as transgenes, and because lymphocytes are endowed with the unique property of allelic exclusion, such transgenic mice become essentially monospecific. Immunomodulatory agents have been expressed in defined tissues or throughout the body, providing tools for studying the functional consequences of dysregulated expression of biological response modifiers.

Loose-leaf Version for Kuby Immunology - Jenni Punt 2018-10-16

Janis Kuby's groundbreaking introduction to immunology was the first textbook for the course actually written to be a textbook. Like no other text, it combined an experimental emphasis with extensive pedagogical features to help students grasp basic concepts. Now in a thoroughly updated new edition, Kuby Immunology remains the only undergraduate introduction to immunology written by teachers of the course. In the Kuby tradition, authors Jenni Punt, Sharon Stranford, Patricia Jones, and Judy Owen present the most current topics in an experimental context, conveying the excitement of scientific discovery, and highlight important advances, but do so with the focus on the big picture of the study of immune response, enhanced by unsurpassed pedagogical support for the first-time learner. Punt, Stranford, Jones, and Owen bring an enormous range of teaching and research experiences to the text, as well as a dedication to continue the experiment-based, pedagogical-driven approach of Janis Kuby. For this edition, they have worked chapter by chapter to streamline the coverage, to address topics that students have the most trouble grasping, and to continually remind students where the topic at hand fits in the study of immunology as a whole.
