"Appropriate for accounting majors AND non-majors. " Students are introduced to an entrepreneur who decides to create his own business (Tom's Wear). In subsequent chapters, students read this running case example and learn financial accounting concepts through Tom's experiences as he grows and expands his business. This is the business process approach: Reimers 1) teaches students about the way a business works and 2) THEN shows how

accounting fits into business processes. All of the traditional financial statements and the accounting equation are emphasized, but the focus is on how accounting relates to business processes. Excel Application Problems, financial statements, internal controls, and business risks are integrated into every chapter. Chapter 4 on accounting procedures (debits and credits) may be included or omitted based upon instructor preference.

Business Process Management - Michael Glykas 2012-09-18

Business Process Management (BPM) has been in existence for decades. It uses, complements, integrates and extends theories, methods and tools from other scientific disciplines like: strategic management, information technology, managerial

accounting, operations management etc. During this period the main focus themes of researchers and professionals in BPM were: business process modeling, business process analysis, activity based costing, business process simulation, performance measurement, workflow management, the link between information technology and BPM for process automation etc. More recently the focus moved to subjects like Knowledge Management, Enterprise Resource Planning (ERP) Systems, Service Oriented Architectures (SOAs), Process Intelligence (PI) and even Social Networks. In this collection of papers we present a review of the work and the outcomes achieved in the classic BPM fields as well as a deeper insight on recent advances in BPM. We present a review

of business process modeling and analysis and we elaborate on issues like business process quality and process performance measurement as well as their link to all other organizational aspects like human resources management, strategy, information technology (being SOA, PI or ERP), other managerial systems, job descriptions etc. We also present recent advances to BPR tools with special focus on information technology, workflow, business process modeling and human resources management tools. Other chapters elaborate on the aspect of business process and organizational costing and their relationship to business process analysis, organizational change and reorganization. In the final chapters we present some new approaches that use fuzzy cognitive

maps and a recently developed software tool for scenario creation and simulation in strategic management, business process management, performance measurement and social networking. The audience of this book is quite wide. The first chapters can be read by professionals, academics and students who want to get some basic insight into the BPM field whereas the remaining present more elaborate and state of the art concepts methodologies and tools for an audience of a more advanced level.
