Automotive Engineering - Brian Cantor 2008-02-19

The current automotive industry faces numerous challenges, including increased global competition, more stringent environmental and safety requirements, the need for higher performance vehicles, and reducing costs. The materials used in automotive engineering play key roles in overcoming these issues. *Automotive Engineering: Lightweight, Functional, and Novel Materials* focuses on both existing materials and future developments in automotive science and technology. Divided into four sections, the book first describes the development of future vehicles, aluminum alloys for manufacturing lighter body panels, and various polymer composites for stronger module carriers. It then reviews state-of-the-art functional materials and smart technologies and projects in which application areas they will most impact future automotive designs and manufacturing. The next section considers the difficulties that must be overcome for

light alloys to displace ferrous-based materials and the increasing competition from lightweight polymeric-based composites. The final section explores newer processing and manufacturing technologies, including welding and joining, titanium alloys, and durable, high-performance composites. With contributions from internationally recognized experts, this volume provides a comprehensive overview of cutting-edge automotive materials and technologies. It will help you understand the key materials and engineering concerns currently confronting this industry.

Automobiles by Architects - Ivan Margolius 2000-04-06

It may seem extraordinary that architects - designers of stationary objects - should concern themselves with automobile design; but the automobile has long touched architects' imaginations, appearing to them as a house on wheels, as mobile accommodation. When the motor-driven vehicle was invented, architects recognised that its image, form and function would

affect the quality of people's lives and their surroundings, and that to propose an automobile was a way to perfect the synthesis of art, design and the latest technology. A number of well-known architects liked to pair the architecture of their houses with their favourite automobiles in order to illustrate the close functional and aesthetic relationship between them. Some believed that their cars had to 'look becoming to' their architecture, and included automobiles in perspective views and photographs of their completed buildings, the result being a harmonising composition of the two elements that stressed their close affinity. The celebrated 'Ten Automobiles' exhibition at the Museum of Modern Art, New York in 1953, with its proclamation that 'automobiles are twentieth-century artefacts', brought into focus the automobile as an influential design object. Architects realised the importance of the automobile as an icon of an era and sought not only to design motorcars but to apply the principles of automotive technology and design to their architecture. This book explores automotive design by leading architects such as Frank Lloyd Wright, Le Corbusier, Walter Gropius, Marcel Breuer, Adolf Loos, Richard Buckminster Fuller, Gio Ponti, Carlo Mollino, Norman Foster, Jan Kaplicky and others and its influence on their architecture.
