Mathematics for Machine Learning - Marc Peter Deisenroth 2020-04-23

The fundamental mathematical tools needed to understand machine learning include linear algebra, analytic geometry, matrix decompositions, vector calculus, optimization, probability and statistics. These topics are traditionally taught in disparate courses, making it hard for data science or computer science students, or professionals, to efficiently learn the mathematics. This self-contained textbook bridges the gap between mathematical and machine learning texts, introducing the mathematical concepts with a minimum of prerequisites. It uses these concepts to derive four central machine learning methods: linear regression, principal component analysis, Gaussian mixture models and support vector machines. For students and others with a mathematical background, these derivations provide a starting point to machine learning texts. For those learning the mathematics for the first time, the methods help build intuition and practical experience with applying mathematical concepts. Every chapter includes worked examples and exercises to test understanding. Programming tutorials are offered on the book's web site.

This unique work features thirty-four cases and articles that are organized into economic categories, providing a conceptual unity and flexibility not found in similar texts. The first half of the text focuses on theory, beginning with a case study that illustrates and unifies the theoretical discussions that follow. It examines market institutions, organizational structure, and individual decision making; interprets moral development as a process within institutional settings; and explains egoism, care, utilitarianism, right, and pluralistic ethical theories. It also discusses how economic analyses of markets and firms incorporate ethical principles, and argues that law reinforces ethical and economic aspects of social institutions important to the continued existence and well-being of society. The second half of the text consists of cases and articles organized by the economic categories of property, risk-reward relationships, information, and competition. Topics covered include corporate control, workplace dangers, marketing, and manufacturing relocation. Applicable in both business schools and philosophy departments, *Business, Institutions, and Ethics* shows how ethical principles can help us gather, sort, and interpret information necessary for making sound business decisions.
