Introduction to Webometrics - Michael Thelwall
2009-10-08

Webometrics is concerned with measuring aspects of the web: web sites, web pages, parts of web pages, words in web pages, hyperlinks, web search engine results. The importance of the web itself as a communication medium and for hosting an increasingly wide array of documents, from journal articles to holiday

brochures, needs no introduction. Given this huge and easily accessible source of information, there are limitless possibilities for measuring or counting on a huge scale (e.g., the number of web sites, the number of web pages, the number of blogs) or on a smaller scale (e.g., the number of web sites in Ireland, the number of web pages in the CNN web site, the number of blogs mentioning Barack Obama before the 2008 presidential campaign). This book argues that it can be useful for social scientists to measure aspects of the web and explains how this can be achieved on both a small and large scale. The book is intended for social scientists with research topics that are wholly or partly online (e.g., social networks, news, political communication) and social scientists with offline research topics with an online reflection, even if this is not a core component (e.g., diaspora communities, consumer culture, linguistic change). The book is also intended for library and information science students in the belief

that the knowledge and techniques described will be useful for them to guide and aid other social scientists in their research. In addition, the techniques and issues are all directly relevant to library and information science research problems. Urban Highways - 1994

Urban Mass Transportation Planning - Alan Black 1995

"This book provides the perfect comprehensive introduction to mass transit for anyone interested in transportation planning as a career, as well as for those who simply have a personal interest in the subject area. It is a

policy-oriented book that contains some technical material, but avoids in-depth coverage of the electric and mechanical engineering aspects." "Distinctly factual, and not ideological, the book offers readers a balanced view of the debate between highways and transit - carefully presenting both sides of controversial issues. The intent is to give readers the solid understanding necessary to analyze problems objectively, and to assure that transit proposals are rationally planned and evaluated." "The book dedicates a full three chapters to historical and political background, and three others to the transit technologies or "modes" currently in use. Furthermore, readers will find coverage of the design of transit networks, operations and management, and impacts on land use, energy consumption, and the environment. Lastly, two chapters cover ridership characteristics, and two deal with economics and finance."--BOOK JACKET.Title Summary field provided by Blackwell North America, Inc. All Rights

Assessment of Higher Order Thinking Skills -

Gregory Schraw 2011-10-01

This volume examines the assessment of higher order thinking skills from the perspectives of applied cognitive psychology and measurement theory. The volume considers a variety of higher order thinking skills, including problem solving, critical thinking, argumentation, decision making, creativity, metacognition, and self-regulation. Fourteen chapters by experts in learning and measurement comprise four sections which address conceptual approaches to understanding higher order thinking skills, cognitively oriented assessment models, thinking in the content domains, and practical assessment issues. The volume discusses models of thinking skills, as well as applied issues related to the construction, validation, administration and scoring of performance-based, selected-response, and constructed-response assessments. The goal of the volume is to

promote a better theoretical understanding of higher order thinking in order to facilitate instruction and assessment of those skills among students in all K-12 content domains, as well as professional licensure and certification settings.

21st Century Innovation in Music Education

- Kun Setyaning Astuti 2019-11-27

Music is an expression of feelings of the soul conveyed through the medium of sound. But not all sounds are music. It might be said that only an organised sound or series of sounds can be called music. Thus, music is connected to the eternal and constant flow and order of the universe, to the laws and rhythms of nature. It can also be said that musical order is comparable to the natural order of the universe. There are laws of a certain nature in the natural

sciences and likewise in music there are structures and procedures, or even rules, that should be followed to produce beautiful music. The International Conference "Innovations for 21st Century Music Education and Research" provided a timely opportunity to take stock of the latest developments in music education and brought together educators, researchers and members of the broader community in a welcoming forum in which they were able to express theoretical and practical views, concepts, research results and principles to help support the further development of music education.
