*Toward Precision Medicine* - National Research  
Council 2012-01-16

Motivated by the explosion of molecular data on  
humans-particularly data associated with

individual patients-and the sense that there are  
large, as-yet-untapped opportunities to use this  
data to improve health outcomes, *Toward  
Precision Medicine* explores the feasibility and  
need for "a new taxonomy of human disease  
based on molecular biology" and develops a  
potential framework for creating one. The book  
says that a new data network that integrates  
emerging research on the molecular makeup of  
diseases with clinical data on individual patients  
could drive the development of a more accurate  
classification of diseases and ultimately enhance  
diagnosis and treatment. The "new taxonomy"  
that emerges would define diseases by their  
underlying molecular causes and other factors in  
addition to their traditional physical signs and  
symptoms. The book adds that the new data  
network could also improve biomedical research  
by enabling scientists to access patients'  
information during treatment while still  
protecting their rights. This would allow the  
marriage of molecular research and clinical data  
at the point of care, as opposed to research  
information continuing to reside primarily in  
academia. *Toward Precision Medicine* notes that  
moving toward individualized medicine requires  
that researchers and health care providers have  
access to very large sets of health- and disease-  
related data linked to individual patients. These  
data are also critical for developing the  
information commons, the knowledge network of  
disease, and ultimately the new taxonomy.
