Menurut World Heart Organization (2015) 17,5 juta jiwa meninggal setiap tahun dan 31% dari kematian di seluruh dunia diakibatkan karena penyakit kardiovaskular Penyakit jantung koroner terbanyak karena aterosklerosis yang sangat berkaitan dengan gangguan metabolisme lipid dan inflamasi. Inflamasi merupakan respons terhadap cedera yang terjadi di dinding vaskular. Cedera ini diakibatkan oleh oxidized low-density lipoprotein (oxLDL) yang berperan sebagai actor utama dalam respons inflamasi dan dimediasi oleh monosit dan limfosit-T. Tingginya angka kesakitan, kecacatan dan kematian akibat

penyakit jantung menuntut kemampuan tenaga kesehatan baik perawat maupun dokter untuk memahami patofisiologi dasar penyakit. Buku ini disusun untuk memenuhi kebutuhan pengetahuan mahasiswa kesehatan, baik perawat maupun dokter untuk memahami konsep dasar patofisiologi penyakit jantung koroner. Penulisan buku ini bertujuan untuk menjelaskan proses inflamasi vaskuler yang terjadi pada penyakit jantung koroner. Keunggulan buku ini adalah menggunakan hasil penelitian sebagai evidence ilmiah dalam mengembangkan suatu konsep dan teori. Rekam jejak penelitian yang telah dilakukan oleh penulis sangat mendukung kompetensi pengembangan wawasan dan ilmu di bidang kardiologi molekuler. Sehingga sangat diharapkan tersusunnya buku ini untuk dimanfaatkan oleh mahasiswa kesehatan baik keperawatan, kedokteran, maupun bagi para peneliti di bidang kardiovaskuler.

Heart-Brain Interactions - Giuseppe Di Pasquale 2012-12-06

In the last decade there has been a growing interest in the study of the interactions between the heart and the brain, especially in the field of cerebral ischemia. The interactions between cardiovascular and cerebrovascular diseases are of relevance not only for research investigation, but also for clinical implications in the daily clinical practice. i.e. A wealth of information has been gathered particularly on three topics, cardiovascular consequences of cerebral injuries, cardioembolic stroke, and association of carotid and coronary artery disease. The available information, however, is still sparse and fragmentary mainly because of the lack of communication between neurologists and cardiologists. With the aim of improving communication between several disciplines and technologies, we started to organize since 1987 in Bologna, Italy, an international Symposium on heart brain interactions to be held every 3 years. Our intention was to gather prominent clinicians and researchers from outstanding cardiologic and neuro logic institutions

actively involved in the study of heart-brain interactions. The ambitious goal has been to fit different pieces of information like in a puzzle. This book originates from the contributions presented at the 2nd Symposium which was held in Bologna on November 30-December 1, 1990. The book is subdivided into three sections: I cardiovascular consequences of cerebral damage, II cardiogenic cerebral ischemia, III cerebrovascular and coronary artery disease.

Secondhand Smoke Exposure and Cardiovascular Effects - Institute of Medicine 2010-02-21

Data suggest that exposure to secondhand smoke can result in heart disease in nonsmoking adults. Recently, progress has been made in reducing involuntary exposure to secondhand smoke through legislation banning smoking in workplaces, restaurants, and other public places. The effect of legislation to ban smoking and its effects on the cardiovascular health of nonsmoking adults, however, remains a question. *Secondhand Smoke Exposure and Cardiovascular Effects* reviews available scientific literature to assess the relationship between secondhand smoke exposure and acute coronary events. The authors, experts in secondhand smoke exposure and toxicology, clinical cardiology, epidemiology, and statistics, find that there is about a 25 to 30 percent increase in the risk of coronary heart disease from exposure to secondhand smoke. Their findings agree with the 2006 Surgeon General's Report conclusion that there are increased risks of coronary heart disease morbidity and mortality among men and women exposed to secondhand smoke. However, the authors note that the evidence for determining the magnitude of the relationship between chronic secondhand smoke exposure and coronary heart disease is not very strong. Public health professionals will rely upon *Secondhand Smoke Exposure and Cardiovascular Effects* for its survey of critical epidemiological studies on the effects of smoking bans and evidence of

links between secondhand smoke exposure and cardiovascular events, as well as its findings and recommendations.
