Vinculación de la prueba de comprensión oral del examen CertAcles de la Universidad de Granada con el MCER - Shackleton, Caroline

Este estudio, como parte del proceso de validación fehaciente del uso e interpretación de las puntuaciones del examen de inglés binivel de la Universidad de Granada (UGR), pretende relacionar,

oficialmente, la prueba de comprensión oral de este examen con el Marco Común Europeo de Referencia (MCER). Con tal fin seguimos las recomendaciones del Consejo de Europa (2009) para determinar unos puntos de corte representativos de los niveles B1 y B2 del MCER. La prueba utilizada en el estudio fue la convocatoria de marzo del 2017 (N=464), que demostró ser un instrumento de medición fiable y apropiado. En el estudio participaron diez expertos, quienes, tras una sesión para familiarizarse con el MCER, realizaron varias sesiones de fijación de puntos de corte. Se utilizaron dos métodos: el método Basket, o de la cesta, para familiarizar a los participantes con los ítems de la prueba. después del cual se analizaron los resultados empleando un modelo de múltiples facetas de Rasch (MFR); por otro lado, el método Bookmark, o del marcador, que incorporó parámetros de dificultad del ítem, resultantes de un análisis Rasch de los puntajes de la prueba. La mediana final de los puntos de corte aportados por los expertos se calculó empleando una probabilidad de respuesta de 0.67, y se transfirió a la escala de capacidad zeta del modelo Rasch para determinar las puntuaciones brutas que representarán los dos niveles de dominio del MCER en cuestión. También se realizaron otros controles de fiabilidad y de validez para proporcionar una documentación transparente sobre el proceso completo, recomendado por el Consejo de Europa (2009). El método de equiparación de puntuaciones del modelo Rasch permite que los puntajes sean reproducibles en futuras versiones de la prueba y, por tanto, apoyan la inferencia de generalización del argumento de validez para la prueba binivel de la UGR.

Data Analysis - Edward L. Wike 2006-08-01

This book is intended for psychology majors and graduate students who are conducting experiments for the first time and are faced with the task of making sense out of their data. This much needed "how-to-do-it" text illustrates the application of statistical methods to the data from small samples. It also serves as a handbook, with twenty-two tables presented at the end of the text that will allow the student to carry out virtually every computation necessary in analyzing his data. Almost all of the examples and illustrations are drawn from actual experiments so that the student can see how professional scientists examine their data. The book also shows students the kinds of data that are encountered in psychological research, the kinds of questions investigators seek to answer, and how these questions are approached. The author asserts that statistics is not an abstract discipline but a tool in research. However, the book also imparts a philosophy of data analysis and its meaning, a concern for questions of the function of data analysis and the interpretations that legitimately can be drawn from data. In brief, *Data Analysis* asks: What kinds of data are met in psychological research? What can we do with these data? What can we conclude as a result of this doing? The book will be invaluable for students who, even though they may have taken a previous statistics course, are still unsure of what statistical techniques should be used in interpreting their data. Edward L. Wike was educated at the University of California at Los Angeles, where he

received his Ph.D. in experimental psychology in 1952. He has contributed many articles to psychology journals and is currently Professor of Psychology, University of Kansas. He was a member of American Psychology Association, Sigma Xi, as well as the Psychonomic Society. He was named Outstanding Educator in America in 1975.

Sensory Evaluation of Food - Harry T. Lawless 2010-09-27

The field of sensory science has grown exponentially since the publication of the previous version of this work. Fifteen years ago the journal *Food Quality and Preference* was fairly new. Now it holds an eminent position as a venue for research on sensory test methods (among many other topics). Hundreds of articles relevant to sensory testing have appeared in that and in other journals such as the *Journal of Sensory Studies*. Knowledge of the intricate cellular processes in chemoreception, as well as their genetic basis, has undergone nothing less than a revolution, culminating in the award of the Nobel Prize to Buck and Axel in 2004 for their discovery of the olfactory receptor gene super family. Advances in statistical methodology have accelerated as well. Sensometrics meetings are now vigorous and well-attended annual events. Ideas like Thurstonian modeling were not widely embraced 15 years ago, but now seem to be part of the everyday thought process of many sensory scientists. And yet, some things stay the same. Sensory testing will always involve human participants. Humans are tough measuring instruments to work with. They come with varying degrees of acumen, training, experiences, differing genetic equipment, sensory capabilities, and of course, different preferences. Human foibles and their associated error variance will continue to place a limitation on sensory tests and actionable results. Reducing, controlling, partitioning, and explaining error variance are all at the heart of good test methods and practices.
