Membrane Physiology - Thomas E. Andreoli 2012-12-06

Membrane Physiology (Second Edition) is a soft-cover book containing portions of Physiology of Membrane Disorders (Second Edition). The parent volume contains six major sections. This text encompasses the first three sections: The Nature of Biological Membranes, Methods for Studying Membranes, and General Problems in Membrane Biology. We hope that this smaller volume will be helpful to individuals interested in general physiology and the methods for studying general physiology. THOMAS E. ANDREOLI JOSEPH F. HOFFMAN DARRELL D. FANESTIL STANLEY G. SCHULTZ vii Preface to the Second Edition The second edition of Physiology of Membrane Disorders represents an extensive revision and a considerable expansion of the first edition. Yet the purpose of the second edition is identical to that of its predecessor, namely, to provide a rational analysis of membrane transport processes in individual membranes, cells, tissues, and organs, which in turn serves as a frame of reference for rationalizing disorders in which derangements of membrane transport processes play a cardinal role in the clinical expression of disease. As in the first edition, this book is divided into a number of

individual, but closely related, sections. Part V represents a new section where the problem of transport across epithelia is treated in some detail. Finally, Part VI, which analyzes clinical derangements, has been enlarged appreciably.

Guyton & Hall: Textbook of Medical Physiology-A South Asian Edition - 2013-07-29

Guyton and Hall Textbook of Medical Physiology continues this bestselling title's tradition as one of the world's favourite physiology textbooks. The main aim of the South Asian Edition of Guyton & Hall Textbook of Medical Physiology is to meet the needs of undergraduate medical students and faculty in South Asia in alignment to the teaching methods in the subcontinent and also in terms of volume of content required. Presentation of the South Asian Edition is quite reflective of the way the lectures are being delivered in the classroom, both in terms of the breakup of topics and the basic level of detailing and explanations. The South Asian Edition incorporates several features aimed at aiding learning for students while retaining the flow and explanatory approach. Chapters have been rearranged and often split to work towards one chapter-one lecture model so that the text is linked to

curriculum objectives which appeals to both students and faculty. Narrative length has been reduced while ensuring the original flow and explanation of concepts is not affected. Topics that are likely to be covered by other subjects and redundancies from the point of view of curriculum have been removed. Includes Learning Objectives and Glossary of Terms in the beginning of every chapter. Mobile App of physiology animations covering difficult and important concepts to enhance the learning process of students.

Control of Cardiac Output - David Young
2010-01-01

Although cardiac output is measured as the flow of blood from the left ventricle into the aorta, the system that controls cardiac output includes many other components besides the heart itself. The heart's rate of output cannot exceed the rate of venous return to it, and therefore, the factors governing venous return are primarily responsible for control of output from the heart. Venous return is affected by its pressure gradient and resistance to flow throughout the vascular system. The pressure gradient for venous return is a function of several factors including the blood volume flowing through the system, the unstressed vascular volume of the circulatory system, its capacitance, mean systemic pressure, and right atrial pressure. Resistance to venous return is the sum of total vascular resistance from the aortic valve to the right atrium. The sympathetic nervous system and vasoactive circulating hormones affect short-term resistance, whereas local tissue blood flow autoregulatory mechanisms are the dominant determinants of long-term resistance to venous return. The strength of contraction of the heart responds to changes in atrial pressure driven by changes in venous return, with small changes in atrial pressure eliciting large changes in strength of contraction, as described by the Frank-Starling mechanism. In addition, the autonomic nervous system input to the heart alters myocardial pumping ability in response to

cardiovascular challenges. The function of the cardiovascular system is strongly affected by the operation of the renal sodium excretion-body fluid volume-arterial pressure negative feedback system that maintains arterial blood pressure at a controlled value over long periods. The intent of this volume is to integrate the basic knowledge of these cardiovascular system components into an understanding of cardiac output regulation. Table of Contents: Introduction / Venous Return / Cardiac Function / Integrated Analysis of Cardiac Output Control / Analysis of Cardiac Output Regulation by Computer Simulation / Analysis of Cardiac Output Control in Response to Challenges / Conclusion / References / Author Biography
